

AVG 8.x Windows GPO Settings

Friday, 14 August 2009

Here's a quick rundown of the Windows Firewall settings required for AVG 8.5 to successfully install remotely.

I have provided these in Windows "GPO" format, as pushing the settings out through your domain's Group Policy is probably the easiest way to do this.

I recommend NOT installing the AVG firewall (if you have Internet Security) in a domain setting. Use the Windows Firewall, I think you'll be happier.

135:TCP:localsubnet:enabled:AVG TCP 135:UDP:localsubnet:enabled:AVG UDP

1356150:TCP:localsubnet:enabled:AVG TCP 6150:UDP:localsubnet:enabled:AVG UDP 6150 These settings are tested to work with AVG 8.0 and 8.5. I don't currently know if the Identity Manager has any special settings.
